

INTENSE - Abstract

The project INTENSE aims at transferring intelligent energy saving measures for municipal housing from “old” EU Member States to “new” Member States, Accession and Candidate countries in Central and Eastern Europe. The project is built on a holistic approach for planning of energy optimized housing. INTENSE is implemented in 12 countries by 28 partners representing multiplier organizations, municipalities and project experts. The project comprises an analysis of legal preconditions, experience exchange on best practice examples, development and implementation of training programmes, pilot planning activities at partner municipalities, and public awareness raising. Increased capacities of local authorities will be an investment to the future for influencing new housing development at legislative, technical and planning level as well as guiding consumer behaviour towards efficient energy use. Experiences and lessons learned within the project will be further disseminated across Europe.
